

Could we kindly examine my current medical state and environmental factors which continue to worsen it? I will list it all, of course, however, should you agree, I propose a gradual approach. By the latter I am implying that we may not hit everything all at once.

Could I be saved in theory? Could I be even saved in practice? You will kindly reply to both this questions with a yes or a no, and you will add an additional explanation. We will consider not only "standard" healthcare, and by extensions "common, regular hospitals," but will also consider top-notch military grade doctors, even a bloody medical team of top-notch military grade doctors. This is my third question; as far as we know, could even such a team save me either in theory or in practice? Yes, or a no, plus explanation. Hence, three yes or no questions, additional explanation is desired.

What I already suffer from:

- Hepatitis C, induced
- HIV, induced
- Carbon Enzymes in my bloodstream, induced
- Meningitis, induced
- Gonorrhea, induced via the Neisseria Gonorrhoeae bacterium, most visibly so in my coffee (my mother is "breeding" these bacteria in the kitchen)
- Inhaling of mold and a variety of bacteria
- Inhaling micro-particles that likely consist of n52 neodymium micro-particles, likely also magnetic aerogel (aerogel doped with iron oxide) micro-particles, potentially (and likely) others too
- always applying a weak yet constant DC (depends on the specific location, yet all objects were coated with an innocuous cream that contains micro-particles of copper, possibly others too
- constant applying of the EMF (not really a weak one)

- due to the UV light I've recovered, one with a label that said "Warning: Radiation!" which is logical since the UV light specifically had gamma rays, assured that we are also dealing with a weak, albeit a constant actual nuclear-type radiation

- the mentioned nuclear radiation was unfortunately increased in the ex-barn structure (a peripheral structure that is a few meters away from the house); it has an enormous roof with old shillings, one that unfortunately (still) contain some asbestos; some studies strongly suggest that such a roof may increase nuclear radiation, should appropriate UV, including gamma rays, be applied to it in a combo with EMF, though reliable data remains elusive

- Cushing's Syndrome (less severe), occurred due to environmental factors

- Diabetes, B-Type, induced

- Low, albeit constant dosages of organophosphates

- A Brain Tumor;

It was induced via tooth sealing; it's likely composition is Ag (Silver), possibly with Hg (Mercury) added and ferromagnetic particles are most definitely a part of this mix (likely just micro-particles of iron (very low possibility), and, most likely, copper micro-particles (not ferromagnetic, but has weak diamagnetic properties and since it is a good electricity conductor, it assures that EMF can manipulate it as if ferromagnetic, though EMF assures that it repels it rather than attracts it).

This, in turn, assured that they were able to push whatever the sealed hole of the tooth contained upward to the brain. That one did hurt, literally. Sure, they blocked my sodium channels to be able to assure that decay of all my teeth would not hurt (especially the tooth in question), and this blocking likely gave way to other, separate approaches.

- Micro-particles of copper (mostly) in my bloodstream and in my body, partially also a multiwall CNT micro-particles

- They were shooting micro-particles at me and more than a lot at a certain point in past (some months ago); I assume that one was CNT. They (mostly) targeted my skull, and I felt at least a few physically penetrating though the skull and into my brain. On the bright side, that one at least doesn't hurt anymore, but did hurt on mentioned occasions.

- They are gassing me with either propane or butane, possibly a mix. They may add other things into the mix as well, most likely hydrogen peroxide (I recovered one tiny bottle of it, not that it matters), potentially other things too. These may include neurotoxins in low dosages or potentially acidic liquid agents (assuring their evaporation first); could be any that go into this group. Possibly other things.

- They tend to use liquid propane + a fat-like substance + an acidic liquid agent, and they are releasing these droplets either on my skin or, if they can, on the top of my head. They mostly target my head/skull.

The fat-like substance assures negligible evaporation of liquid propane, and the acidic liquid agent assures that it penetrates through the skin and into the skull, and by extension into the skull's bone marrow.

My brain may or may not suffer from a tiny amount of this too, although I cannot say the last part with certainty.

Targeting my skull's bone marrow assured by now that my skull is literally falling apart, or, more precisely, its parts/its bones are getting loose.

All my skull suture parts (mostly squamous suture, though coronal and lambdoid ones too), or in more layman terms, the parts where skull's bones are "stitched" together began loosening up to the point where they, at the very least, affect my intracranial pressure and in turn assure that I suffer deeply, not only physically but psychologically as well.

Since my skull's bone marrow, and all its bones are now very soft and their interconnection is loosening up, my very skull began to very slowly, yet also surely change its very shape.

The latter implies that the brain will be forced to adjust, including all its centers, and this could have huge neurological implications, and, by extension, psychological ones too, though I believe that my skull will literally "fall apart" just enough so that the mentioned won't become a practical issue.

The mix I mentioned must contain specific neurotoxins (or applicable) which affects my mood directly and immediately no matter where those droplets fall.

- Highly varying RF, usually between -60dB and -80dB, varying from around 100Hz and up to well over 20kHz, about three to four times per a single second

- Invisible blue light spectrum, applied even in all OEM-ODM made light bulbs, elsewhere too (e.g. the screen of the OEM-ODM made laptop, the one I am using right now)

This list? Most likely goes on, but I listed only things I can either confirm or things that I strongly suspect.
